

JGet

User Documentation

Walter Herold Veedla

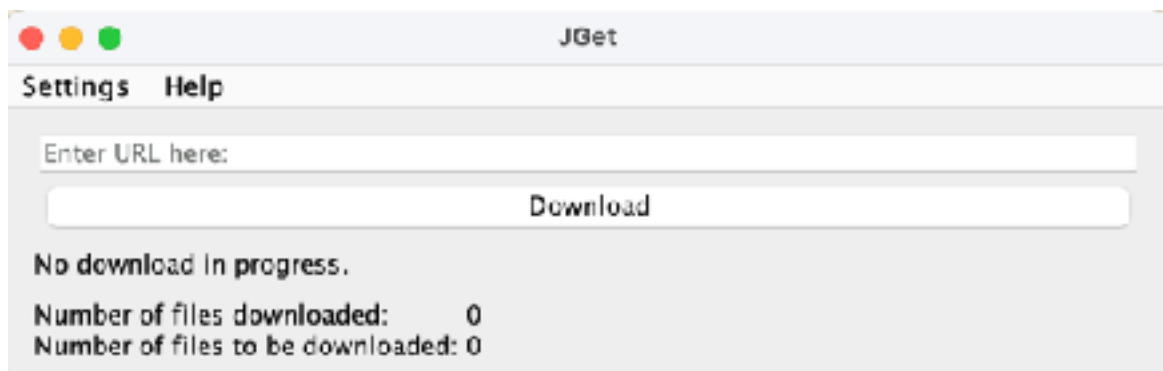

Version 1.0.0

1. Basic information

JGet is a simple tool for downloading websites for the purpose of grabbing a website in its current state, making it browsable locally. JGet features a graphical user interface for interaction with the program.

2. Getting started

When starting the application, You shall see the following window, with the default Look-and-Feel of Your system:

- The menu bar features the settings menu for additional control over the download process.
- The help menu allows for opening this documentation file and seeing the about info.
- The text field, marked as "Enter URL here" is where You should enter the website address You wish to download.
- The button "Download" should be pressed to initiate the download.

It does so by searching HTML documents for outgoing links, queueing them for them to be downloaded and downloading the files to disk. This process is repeated until the entire website is downloaded
